

A new strategy for overhanging river management in the downstream of the Yellow River

By LI Lihong

Abstract: With the development of China's soil and water conservation research and desertification control , there are currently over 30 research institutes and universities who are carrying out research and teaching related to soil and water conservation and desertification control. According to the national strategy and discipline construction of ecological protection and high-quality development of the Yellow River Basin, Wang Fei, a researcher of the Institute of Soil and Water Conservation of the Ministry of Water Resources, Chinese Academy of Sciences, puts forward some suggestions on the management method of "hanging river in the lower reaches of the Yellow River basin". He suggested that the method of "refining coarse sand in the lower reaches of the Yellow River and separating coarse sand from fine sand" should be adopted to control the hanging river.

Key words: Soil and water conservation, desertification, discipline construction
